

**PinPoint**

# Problem Statement

Every day, millions of pedestrians step into the unknown. While drivers have real-time navigation to avoid accidents, construction, and hazards, walkers are left entirely in the dark. They are forced to navigate broken sidewalks, poorly lit paths, and active danger zones by trial and error. In a world built for vehicles, pedestrian safety is treated as an afterthought.

# Introducing PinPoint

Real-time, crowd-sourced situational awareness for pedestrians

## Live Alerts

Know before you step. Instantly receive hyper-local warnings and notifications about immediate pedestrian obstacles—from active construction zones and blocked sidewalks to icy paths and safety hazards.

## Real-time tracking

Navigation built for feet, not wheels. Dynamic routing that continuously adapts to live sidewalk conditions, ensuring you are always on the most efficient, accessible, and safest path in real time.

## User contribution

Powered by the community. Empower pedestrians to effortlessly drop pins, report active hazards, and update infrastructure changes, creating a self-sustaining network effect that keeps the entire city safe.

# Value – Who we are aiming to help

Students & Night  
Commuters

Walking home alone late at night on sprawling, dimly lit campuses or urban centers, needing paths prioritized by active community presence and lighting.

The Accessibility  
Community

Individuals in wheelchairs, parents with strollers, or the elderly who can be completely stranded by a single unmapped broken sidewalk, steep curb, or sudden construction blockage.

Urban pedestrians

Everyday citizens forced to navigate dynamic city hazards, especially on grid patterns

# Situation

Meet Kyle. He is a college student walking back to his dorm at 2:00AM.

## Without PinPoint

- Kyle relies on standard maps, which route him down the shortest physical path
- Halfway there, he hits a sudden, unmapped sidewalk closure due to utility work, forcing him into a dark, isolated alleyway
- He feels unsafe, anxious, and completely stranded in the dark

## With PinPoint

- Kyle opens PinPoint. The **Real-Time Tracking** filters his route based on active pedestrian presence and well-lit paths.
- A block away, he receives a **Live Alert** flagged by another student 15 minutes prior.
- The app reroutes him safely around the block. Kyle arrives home safely and hassle-free.

# Closing Statement

## Next Steps

Launching a beta specifically tailored for dense pedestrian ecosystems, like our own university campus, where dynamic infrastructure changes, student foot traffic, and night safety are daily priorities.

# PinPoint

## Ultimate Goal

Moving beyond standard, vehicular-biased navigation to map the world at a human scale.

Because everyone deserves a safe path home. Let's make our streets safer, one pinpoint at a time
